- VI. Microsoft Used Predatory and Anticompetitive Conduct to Impede Other Platform
 Threats as Well, Thereby Further Entrenching Its Operating System Monopoly
 - A. Microsoft responded to the threat that Java posed to the applications barrier to entry by engaging in predatory and anticompetitive conduct
- 318. As explained, Java technology, both alone and in concert with non-Microsoft browsers, poses a threat to Microsoft's operating system monopoly because it holds out the possibility of an effective cross-platform middleware that can significantly reduce the applications barrier to entry.
 - i. <u>See supra Part III.C.;</u> ¶¶ 57-59.
- 319. Microsoft recognized the Java threat and, in conjunction with its effort to blunt the browser threat, engaged in a series of actions designed to interfere with the development, distribution, and usage of cross-platform Java.
- 319.1. Microsoft developed and then widely distributed, in part through Windows, a "polluted" version of Java that is not cross-platform.
 - i. <u>See infra Part VI A.1.;</u> ¶¶ 320-321.
- 319.2. Microsoft's purpose in creating and widely disseminating its version of Java was to fragment cross-platform Java and thus hinder the threat Java could pose to the applications barriers to entry.
 - i. <u>See infra Part VI.A.2.;</u> ¶¶ 324-326.
- 319.3. In addition to polluting Java, Microsoft engaged in anticompetitive conduct designed to cripple cross-platform Java.
 - i. <u>See infra Part VI.A.3.b.(1);</u> ¶¶ 330-332.
 - 319.3.1. Microsoft, through its predatory campaign against Netscape,
